The Ab, which can be used to treat sepsis, and thinibits TWF-alpha activity, can be used to treat sepsis, autoimmune diseases, e.g. rheumatoid arthritis, rheumatoid spondylitis, osteoarthritis, gouty arthritis, allergy, multiple commune diseases, autoimmune uveitis or nephrotic syndrome, infectious diseases, malignancy, pulmonary, intestinal, cardiac or inflammatory bone disorders, bone resorption disease, calcoholic, viral or fulminant hepatitis, coaquiation disturbances, burns, reperfusion injury, keloid formation, scar tissue formation, pyrexia, periodontal disease, obesity and radiation toxicity. The character adhesion molecular, introduced expression endothelial cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches

High affinity antibodies against human TNF alpha - useful TNF alpha activity, e.g. to treat autoimmune diseases and Claim 20; Page 74; 102pp; English.

Claim 20; Page 74; 102pp; English.
High affinity antibodies against human TNF alpha - useful TNF alpha activity, e.g. to treat autoimmune diseases and Claim 16; Page 76; 102pp; English.

The present sequence is a novel anti-human tumour necrosis factor-alpha (TNF-alpha) antibody (Ab) heavy chain variables.

The present sequence is a novel anti-human tumour necrosis

(factor-alpha (TWP-alpha) antibody (Ab) heavy chain complementarity

(determining region 3 (CDR3).

The Ab dissociates from TWF-alpha with a Kd of 1x10 power -8 M or

(less and has a Koff rate constant of 1x10 power -3 s power -1 or

(less (both determined by surface plasmon resonance), and

(conclusives human TWF-alpha cytotoxicity in a standard in vitro

(constant session with an IC50 of 1x10 power -7 M or less. The Ab, which

(constant TWF-alpha activity, can be used to treat sepsis,

(autoimmune diseases, e.g. rheumatoid arthritis, rheumatoid

(spondylitis, osteoarthritis, gouty arthritis, allergy, multiple

(sclerosis, autoimmune diabetes, autoimmune uveitis or nephrotic

(syndrome, infectious diseases, malignancy, pulmonary, intestinal,

(corriace or inflammatory bone disorders, bone resorption diseases,

alcoholic, viral or fulminant hepatitis, coagulation disturbances,

burns, reperfusion injury, keloid formation, scar tissue formation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    heavy chain; complementarity determining region 3; inhibition; treatment; sepsis; disease; autoimmune disease; infectious disease; malignancy; pulmonary disorder; intestinal disorder; hepatitis; cardiac disorder; inflammatory bone disorder; reperfusion injury; bone resorption disease; coagulation disturbance; burn; ELAM-1; keloid formation; scar tissue formation; pyrexia; HUVEC; periodontal disease; obesity; radiation toxicity; endothelial cell leukocyte adhesion molecule-1; human umbilical vein endothelial cell.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Š
                                                                                                          The present sequence is a novel anti-human tumour necrosis
factor-alpha (TNF-alpha) antibody (Ab) heavy chain complementarity
determining region 3 (CDR3).
The Ab dissociates from TNF-alpha with a Kd of 1x10 power -8 M or
less and has a Koff rate constant of 1x10 power -3 s power -1 or
less (both determined by surface plasmon resonance), and
neutralises human TNF-alpha cytotoxicity in a standard in vitro
neutralises human TNF-alpha cytotoxicity in a standard in vitro
1299 assay with an IC50 of 1x10 power -7 M or less. The Ab, which
inhibits TNF-alpha activity, can be used to treat sepsis,
autoimmune diseases, e.g. rheumatoid arthritis, rheumatoid
spondylitis, osteoarthritis, gouty arthritis, rheumatoid
spondylitis, osteoarthritis, gouty arthritis or nephrotic
syndrome, infectious diseases, malignancy, pulmonary, intestinal,
cardiac or inflammatory bone disorders, bone resorption disease,
alcoholic, viral or fulminant hepatitis, coagulation disturbances,
burns, reperfusion injury, kelold formation, scar tissue formation,
pyrexia, periodontal disease, obesity and radiation toxicity. The
Ab also inhibits TNF-alpha induced expression of endothelial cell
ieukocyte adhesion molecule-1 (ELAM-1) on human umbilical vein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

PT High affinity antibodies against human TNF alpha - useful to inhibit PT TNF alpha activity, e.g. to treat autoimmune diseases and cancer PT Claim 20; Page 73; 102pp; English.

CC The present sequence is a novel anti-human tumour necrosis factor-alpha (TNF-alpha) antibody (Ab) heavy chain complementarity CC determining region 3 (CDR3).

CC The Ab dissociates from TNF-alpha with a Kd of 1x10 power -8 M or Cless and has a Koff rate constant of 1x10 power -3 s power -1 or CC less and has a Koff rate constant of 1x10 power -3 s power -1 or CC less (both determined by surface plasmor resonance), and neutralises human TNF-alpha cytotoxicity in a standard in vitro CC inhibits TNF-alpha activity, can be used to treat sepsis, autoimmune diseases, e.g. rheumatoid arthritis, rheumatoid spondylitis, osteoarthritis, gouty arthritis, allergy, multiple CC syndrome, infectious diseases, malignancy, pulmonary, intestinal, CC ardiac or inflammatory bone disorders, bone resorption disease, CC syndrome, infectious diseases, malignancy, pulmonary, intestinal, CC ardiac or inflammatory bone disorders, bone resorption disease, CC burns, reperfusion injury, keloid formation, scar tissue formation, CC pyrexia, periodontal disease, obesity and radiation toxicity. The Naleviche adhesion molecule-1 (ELAM-1) on human umbilical vein condition of endothelial cells (HVFC)
                                                                                                                                                                                                                                                                                                                                                                              Query Match

Claim 1, Page 30-31; 58pp; Japanese.

CC The sequences given in R47205-08 represent the light and heavy chain, convariable and constant regions of a chimeric recombinant antibody and constant region is that of a human antibody and constant region is that of a human antibody and constant region is that of a human antibody and constant region is that of a human antibody and constant region is that of a human antibody and conservation of the variable region is from a mouse anti-human II-1 antibody, and a heavy (H) chain in which the constant region is that constant region is that constant region is a mouse-human graft containing the CDR regions of conservation of is a mouse-human graft containing the CDR regions of conservation of its a mouse-human graft containing the CDR regions of conservation human II-1 antibody. The chimeric antibody is used to consuce anti-human II-1 antibody. The chimeric antibody is used to consuce anti-human graft containing the cDR regions of conservation or leakemia. It can also be labeled and used for conservation or leakemia. It can also be labeled and used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches

                                                                                                                                                                                                                                                                                               This sequence represents the heavy chain mature peptide of a chimeric recombinant antibody against human interleukin-1 (II-1). The chimeric antibody has a light (L) chain in which the constant region is that of a human antibody and the variable region is from a mouse anti-human II-1 antibody and an eavy (H) chain in which the constant region is that of a human antibody and the variable region is from a mouse anti-human II-1 antibody, and a heavy (H) chain in which the constant region is that of a human antibody and the variable region is from a mouse anti-human II-1 antibody or is a mouse-human graft containing the CDR regions of mouse anti-human II-1 antibody. The chimeric antibody is used to treat diseases in which abnormal amounts of II-1 are produced, eg. inflammatory disease, arteriosclerosis, diffused intravascular coagulation or leukement II can also be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        variable and constant regions of a chimeric recombinant antibody against human interleukin-1 (IL-1). The antibody has a light (L) chain in which the constant region is that of a human antibody and the variable region is from a mouse anti-human IL-1 antibody or is a mouse-human graft containing the CDR regions of mouse anti-human IL-1 antibody, and a heavy (H) chain in which the constant region is that of a human antibody and the variable region is from a mouse anti-human IL-1 antibody or is a mouse-human graft containing the CDR regions of treat diseases in which abnormal amounts of IL-1 are produced, eg. inflammatory disease, arteriosclerosis, diffused intravascular coagulation or leukemia. It can also be labelled and used for diagnostic imaging of IL-1 producing sites in vivo.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Mouse/human chimeric antibody against human interleukin-1 - for treatment of diseases in which production of interleukin-1 is abnormal, and for diagnostic imaging of interleukin-1 production sites in vivo

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       PT Rat interleukin-1 beta converting enzyme related protease - used for proteasting Alzheimer's disease, amyotrophic lateral sclerosis, and treating Alzheimer's disease, amyotrophic lateral sclerosis, and protease related protease, overexpression of the related protease, overexpression of which converting enzyme (ICE) related protease, overexpression of which converting enzyme (ICE) related protease. The amino acid converting enzyme (ICE) related protease is present in the rate brain cDNA library. ICE related protease is present in the central nervous system and is enriched in central neurons concluding pyramidal neurons and granule neurons of the hippocampus cand cerebral cortex. An expression vector capable of producing the ICE related protease in a host cell is claimed. The protease can be used in a claimed method to identify compounds that inhibit apoptosis. Such inhibitors can be used to treat Alzheimer's can be used to treat Alzheimer's chisese, amyotrophic lateral sclerosis (ALS), head trauma or other cased against the protease may be used dor diagnosis of these conditions states, or in their treatment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

CT This is the Candida albicans oligopeptide transporter, OPT1. Its amino acid sequence was deduced from an isolated genomic clone (see V49601) obtained through heterologous expression in Saccharomyces cerevisiae di-/tripeptide transport mutant PBIX-9B. When CL transformed with a plasmid harboring OPT1, mutant PXIX-9B, which conditions used, was conferred with an oligopeptide transport occurrence of the radiolabeled tetrasport activity under the conditions used, was conferred with an oligopeptide transport occurrence of the radiolabeled tetrasport protein increase in the initial cuptake rate of the radiolabeled tetrasportide Lys-Leu-Gly-(3H)Leu. The deduced protein product contains 12 hydrophobic regions, suggestive of a membrane transport protein. The oligopeptide curansporter facilitates the uptake of normally non-permeable drugs, and is especially used to target antifungals, specifically anti-Candida drugs, which are conjugated, linked or attached to the peptide being transported. It can also be used to identify plant coligopeptides as herbicides or growth stimulants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

New Streptococcus pneumoniae capsular polysaccharide genes - used for detection, serotyping and for diagnosis and prevention of S. pneumoniae infection
Disclosure; Page 178-180; 226pp; English.
Sequences encoding the 5' flanking region of the capsular polysaccharide gene (cps) of Streptococcus pneumoniae and which are of sufficient length to allow hybridisation under standard hybridisation conditions to a S. pneumoniae cps gene flanking region may be used in methods to detect and serotype S.pneumoniae. They may also be used for the diagnosis and prevention of S. pneumoniae
                                                                                                                                                                                                                                                                                                                                     Capsular polysaccharide of Streptococcus pneumoniae (CpsU).

Statistics: Mean 25.125; Variance 38.161; scale 0.658

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

AT THE ONSET OF APOPTOSIS I PROTEOLYTICALLY CLEAVES POLY(ADP-RIBOSE) POLYMERASE (PARP) AT A 216-ASP-1-GLY-217 BOND. CLEAVES AND ACTIVATES STEROL REGULATORY ELEMENT BINDING PROTEINS (SREBPS) BETWEEN THE BASIC HELIX-LOOPHELIX LEUCINE ZIPPER DOMAIN AND THE MEMBRANE ATTACHMENT DOMAIN. CLEAVES AND ACTIVATES CASPASE-6, -7 AND -9 (BY SIMILARITY). SUBUNIT: HETERODIMER OF A 17 KD (P17) AND A 12 KD (P12) SUBUNIT (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SUBCELLULAR LOCATION: CYTOPLASMIC.

SYBCELLULAR LOCATION: CYTOPLASMIC.

PYM: CLEAVAGE BY GRANZYME B, CASPASE-6, -8 AND -10 GENERATES THE PYMORE SUBUNITS. ADDITIONAL PROCESSING OF THE PROPEPTIDES THO ACTIVE SUBUNITS. ADDITIONAL PROCESSING OF THE ACTIVATED PROTEASE. ACTIVE HETERODIMERS BETWEEN THE SMALL SUBUNIT OF CASPASE-7 PROTEASE AND THE LARGE SUBUNIT OF CPP32 ALSO OCCUR PACE VERSA (BY SIMILARITY).

SYMILARITY: BELONGS TO PEPTIDASE FAMILY C14; ALSO KNOWN AS THE CASPASE FAMILY.
                                                                                                                                                                                                                                              YLSTSFSLDY

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ADULT BRAIN.

PTM: CLEAVAGE BY GRANZYME B, CASPASE-6, -8 AND -10 GENERATES TO ACTIVE SUBUNITS. ADDITIONAL PROCESSING OF THE PROPERTIDES LIKELY DUE TO THE AUTOCATALYTIC ACTIVITY OF THE ACTIVATED PROTEASE. ACTIVE HETERODIMERS BETWEEN THE SMALL SUBUNIT OF CASPASE-7 PROTEASE AND THE LARGE SUBUNIT OF CP932 ALSO OCCUR FUCE VERSA (BY SIMILARITY).

SIMILARITY: BELONGS TO PEPTIDASE FAMILY C14; ALSO KNOWN AS THE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    FUNCTION: INVOLVED IN THE ACTIVATION CASCADE OF CASPASES RESPONSIBLE FOR APOPTOSIS EXECUTION. AT THE ONSET OF APOPTOSIS IT PROTEOLYCITCALLY CLEAVES POLY(ADP-RIBOSE) POLYMERASE (PARP) AT A 216-ASP-1-GLY-217 BOND. CLEAVES AND ACTIVATES STEROL REGULATORY ELEMENT BINDING PROTEINS (SREBPS) BETWEEN THE BASIC HELIX-LOOP-HELIX LEUGINE ZIPPER DOMAIN AND THE MEMBRANE ATTACHMENT DOMAIN. CLEAVES AND ACTIVATES CASPASE-6, -7 AND -9 (BY SIMILARITY). SUBUNIT: HETERODIMER OF A 17 KD (P17) AND A 12 KD (P12) SUBUNIT
                                                                                                                                                                                                                                                                                                                                                              ween the Swiss Institute of Bioinformatics and the European Bioinformatics Institute. Jr., L.F.; O'Dowd, B.F.
Blochem. Blophys. Res. Commun. (1997) 239:543-547
A cluster of four novel human G protein-coupled receptor
genes occurring in close proximity to CD22 gene on
chromosome 19413.1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Devlin, K.; Churcher, C.M. submitted to the EMBL Data Library,

#title Primary structures of the heterogeneous nuclear
ribonucleoprotein A2, B1, and C2 proteins: a diversity of
RNA binding proteins is generated by small peptide inserts.

#title Sequence and expression of the gene encoding the
corrinoid/iron-sulfur protein from Clostridium
thermoaceticum and reconstitution of the recombinant
protein to full activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                340-358

Title: >US-08-599-226-31
Description: (1-12) from USO8599226.pep
Perfect Score: 82

Scoring table: PAM 150
Gap 15

Sequence:

1 ASYLSTSFSLDY 12

Searched: 106580 seqs, 10152877 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Statistics: Mean 16.747; Variance 61.471; scale 0.272

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
